

Pro Grip Heavy Duty

The Pro Grip slat is the solution to give both the sow and the piglets a perfect grip on a plastic slat. This makes it ideal for loose housing in the farrowing pen. But they can also be used in conventional farrowing pens, in preparation for future loose housing.

The patented slat has wide high and low squares, which give the sow grip by preventing the paws to slip away. But it also gives the sow comfort when lying down. Embedded in the Pro Grip slat is our successful piglet profile, which gives the piglets their grip when they are suckling or playing. The droplet-shaped profile makes the slat very easy to clean.

Extra strong

The extra strong, curved ribs and reinforced slot-in system prevent the slat from bending, result:

- The solid surface gives the sow more confidence to move
- Creates a safer environment for the piglets as the sow has a better grip
- Durable, longer life for the slat

Added comfort

The rounded edges and lowered profile create:

- Optimal comfort when the sow and piglets lie down
- Reduced risk of pressure sores

Healthier animals

The uniform perforations and droplet shaped underside without corners and depressions prevents soil accumulating in the slat.

This ensures the floor is:

- Safe for the piglets' small feet
- Easy to clean
- More resistant to bacteria

Pro Grip slats can be combined with all of the other materials in the farrowing floor in preparation for conversion to a floor for loose sow housing.
